

SkillSync

Problem Statement

Companies and colleges face major challenges in conducting fair, scalable, and skill-based recruitment processes. Manual resume screening consumes time and may introduce bias. Communication skills, confidence levels, technical abilities, and personality traits are difficult to evaluate consistently for a large number of candidates. Students and job seekers often do not receive proper guidance or improvement feedback after interviews.

Proposed Solution

The proposed SkillSync platform automates recruitment and assessment processes using Artificial Intelligence, Natural Language Processing, Computer Vision, and Audio Analysis. The system analyzes resumes, conducts AI-based interviews, evaluates candidate responses, analyzes confidence and communication skills, and generates detailed performance reports with personalized feedback and improvement suggestions.

System Input Structure

Module	Input Type	Purpose
Resume Analyzer	Text Input (PDF/DOC Resume)	Extract skills, education, & experience
Interview Chatbot	Text Input	Generate and evaluate interview response
Face Analysis	Image / Video Input	Detect emotions and confidence levels
Voice Analysis	Audio Input	Analyze speech clarity & communication
Coding Assessment	Code / Text Input	Evaluate programming knowledge & logic
Performance Dashboard	Text + Graphical Output	Generate scores, analytics, & feedback

Project Outcome

The outcome of the SkillSync project is a smart and scalable recruitment platform capable of reducing recruiter workload, minimizing bias in candidate evaluation, and improving hiring efficiency. The system provides accurate skill assessment, real-time feedback, emotion and communication analysis, and detailed performance reports. It helps colleges and organizations conduct faster, transparent, and data-driven interview processes while supporting candidates in improving their technical and communication abilities.
